

Keeping Secure

July 2019

It's not new information that cyber attacks occur frequently. We must be especially careful to keep our private information truly private. In 2018, total cost for globally committed cybercrime was over \$1 trillion dollars! What is an even more striking and useful number is that 95% of cybersecurity breaches are due to human error.¹ If that's the case, what can we do to better protect ourselves?

[Here](#) is an article that shares some helpful tips on how to identify malicious emails – a very common cyber-attack. At the surface avoiding malicious emails might sound like an easy task, but cybercriminals have reached an impressive level of skill in their schemes.

In an effort to better protect client information, we have a robust infrastructure. Instead of having physical servers in our office that house data, we operate within a cloud environment that is provided and secured by our technology solutions provider, ITEGRIA. Follow this [link](#) to find information on the infrastructure.

We hope everyone is enjoying their summer.

All the best,

The McCarthy Grittinger Team
